Tonny Ochieng — Quavatel Fiber Infrastructure Projects

Industrial attachment context

Organization: Quavatel
Department: Network Operations Center (NOC)
Period: 01 May – 31 July 2026
Duration: 12 weeks

This report summarizes the fiber and telecommunications project scope documented in the Quavatel recommendation letter. It intentionally uses non-numerical descriptions because the letter did not provide counts, restoration times, splice totals, or uptime figures.

1. Fiber-to-the-Home (FTTH) deployment support

Supported FTTH deployment activities along the service path from the access network toward customer premises. The work included connection checks, service verification, fault reporting, and connectivity troubleshooting to support stable service delivery.

Project flow: Access network → connection checks → service verification → customer premises, with fault reporting and troubleshooting support throughout.

2. Fiber fault restoration and splicing

Gained practical exposure to fiber fault restoration, fiber splicing, network troubleshooting, and restoration activities used to maintain reliable telecommunications connectivity. This work strengthened practical understanding of physical-link faults and the operational process used to restore service.

Project flow: Network fault → investigation → troubleshooting → restoration → splicing → connectivity restored.

3. Fiber installation, commissioning, and quality assurance

Participated in field surveys, fiber installation, commissioning, and quality-assurance processes. Supported organized cable routing, infrastructure checks, and documentation of field findings and maintenance activities.

Project flow: Field survey → installation → cable routing → infrastructure checks → commissioning → quality assurance → documentation.

Related NOC and infrastructure exposure

The attachment also included practical exposure to real-time network monitoring, performance analysis, incident management, operational reporting, ticketing, and network management platforms including CDMS and ADVA. Additional systems-administration exposure covered workstation maintenance, software deployment, operating-system updates, end-user support, workstation security, and preventive maintenance.

Evidence and scope note

The project descriptions above are based on the attached Quavatel recommendation letter and the portfolio owner’s supplied context. No numerical performance metrics are claimed. Recommendation letter: available on request.
